

PlayerScore

Strategic Roadmap 2026

Football Analytics Platform · TwinAnalytics

February 2026 · Confidential

Transparent, benchmark-driven player scoring for professional clubs,
scouts, and football data enthusiasts - no ML black-box, just clarity.

1. Executive Summary

What is PlayerScore?

PlayerScore is an open-source football analytics platform that computes role-aware performance scores (0-1000) for outfield players across Europe's Big-5 leagues. Data is scraped weekly from FBref via Playwright and processed through a transparent, benchmark-driven pipeline - no machine learning, no hidden weights, full auditability.

Unique Selling Points

- Transparent scoring: every weight and benchmark is human-readable and version-controlled.
- Role-specific: separate scoring models for FW, Off_MF, MF, Def_MF, DF.
- Weekly fresh data: GitHub Actions CI/CD updates every Tuesday on a self-hosted macOS runner.
- Pizza charts with peer-percentile benchmarking across Big-5 competitions.
- Market value integration via Transfermarkt (fuzzy-matched).
- Hidden Gems detector: high score, low market value - actionable scouting leads.
- Fully open source and deployable on Streamlit Cloud for zero hosting cost.

Target Audiences

- Football data enthusiasts & analysts - exploratory scouting tool.
- Amateur clubs & academies - affordable alternative to Wyscout/Hudl.
- Sports journalists - data-backed player profiles.
- Recruitment agencies - shortlisting and valuation cross-check.
- Aspiring football analysts - learning resource and portfolio showcase.

2. Competitive Positioning

Market Landscape

The football analytics market is dominated by expensive enterprise tools. PlayerScore occupies a unique niche: free, explainable, and community-driven.

Platform	Data	Scoring	Price/yr	Transparency
PlayerScore	FBref (weekly)	Rule-based, open	Free	Full (OSS)
Smarterscout	Opta	ML black-box	~EUR 3k-EUR 8k	None
Wyscout / Hudl	Video + event data	Proprietary	~EUR 5k-EUR 20k	None
FBref.com	StatsBomb	Raw stats only	Free	N/A (raw)
Sofascore	Own tracking	Rating (opaque)	Free/EUR 8/mo	Minimal

Key Differentiator

While competitors offer depth (video, event data, tracking), PlayerScore offers breadth + transparency at zero cost. Analysts can fork the repo, modify benchmarks for a specific league or age group, and run the pipeline on their own data.

3. Monetisation Strategy

Tier Overview

PlayerScore will follow a freemium SaaS model with four tiers. The free tier drives organic growth; paid tiers unlock data exports, API access, and white-label deployment.

Free	EUR 0 / month	All current features - full Big-5 history, pizza charts, rankings.
Pro	EUR 9 / month	CSV & PNG exports, advanced filters, season-over-season trend charts.
Scout	EUR 29 / month	API access (JSON), comparison reports (PDF), Telegram alerts for top finds.
Club / B2B	Custom	White-label deployment, custom benchmarks, priority data updates, SLA.

Revenue Projections (Year 1)

Tier	Target Users	Monthly	Annual	Notes
Pro	200	EUR 1,800	EUR 21,600	Early adopters
Scout	30	EUR 870	EUR 10,440	Freelance scouts
Club/B2B	2	EUR 800	EUR 9,600	Regional clubs
Total	232	EUR 3,470	EUR 41,640	Conservative case

4. Feature Roadmap Q1-Q4 2026

Q1 2026 (Jan-Mar)

- Player comparison mode (two-player side-by-side pizza + score bars)
- Download PNG player card (share-ready)
- Rankings -> click row -> jump to player profile
- Dark mode refinement (GitHub-Dark palette)
- PDF roadmap generation (fpdf2)

Q2 2026 (Apr-Jun)

- Pro tier launch on Stripe (CSV export, PNG download, trend charts)
- Season-over-season score trend line per player
- Goalkeeper scoring model (separate from outfield)
- Telegram bot: weekly 'Hidden Gem' alert for subscribers
- Club squad strength heatmap (all positions visualised)

Q3 2026 (Jul-Sep)

- Scout tier: REST API (FastAPI) with JSON endpoints
- PDF comparison reports (two players, automated layout)
- xG over-/underperformance tracker per season
- Support for second-tier leagues (Championship, 2. Bundesliga, Serie B)
- User accounts (Supabase) for saving watchlists

Q4 2026 (Oct-Dec)

- Club/B2B white-label: custom logo, custom benchmarks, private deployment
- Age curve modelling (prime years vs. current score)
- Transfer value estimator (regression on score + age + position)
- Mobile-first Streamlit layout (responsive sidebar)
- Open API launch with public docs (Swagger/OpenAPI)

5. Technical Next Steps

Infrastructure

- Migrate CI/CD from self-hosted macOS runner to GitHub-hosted (ubuntu-latest) for reliability.
- Add Playwright caching to reduce cold-start scraping time from ~25 min to ~10 min.
- Docker-compose for local development (Streamlit + data volume mount).

Data Pipeline

- Add data validation step (Great Expectations or Pandera) after scraping.
- Version processed CSVs with DVC for reproducible analysis.
- Add Goalkeeper scraping category (currently excluded from outfield scoring).

Scoring Engine

- Introduce season-weighted career scores (recent seasons count more).
- Add role confidence score: how many 90s needed for reliable ranking.
- Benchmark auto-calibration: refit p95 benchmarks annually from fresh data.

Application

- Extract render functions from app.py (4,500 lines) into src/views/ modules.
- Add pytest suite for scoring.py and processing.py (target: 80% coverage).
- Streamlit caching audit: replace st.cache_data with smarter TTL settings.

Security & Privacy

- Add rate limiting on the future API (FastAPI middleware).
- GDPR-compliant usage analytics (self-hosted Umami or Plausible).
- Secret scanning in CI (GitHub Advanced Security).

6. Key Performance Indicators

KPI	Target (6 months)	Target (12 months)	Measurement
Monthly Active Users (Streamlit)	500	2,000	Streamlit
GitHub Stars	150	500	GitHub
Paying subscribers (Pro+)	50	250	Stripe
Monthly Recurring Revenue	EUR 500	EUR 3,500	Stripe
Pipeline success rate (CI)	>= 95%	>= 98%	GH Actions
Data freshness (hours since update)	< 168 h	< 48 h	App footer
Test coverage (scoring + processing)	30%	80%	Codecov
